ABSTRACT

Operating system methods and techniques for supporting one or more

custom execution environments (CE²s) are provided. According to one embodiment, a

determination is made with respect to which system resources of a computer system, if

any, are to remain under control of a resident operating system of the computer system

and which of the system resources are to be placed under control of one or more CE²s.

The system resources are then partitioned among the resident operating system and the

one or more CE²s by associating one or more partitions of the system resources with the

[000106]

one or more CE²s. Such partitioning may be performed by the resident operating system

by employing hardware-based isolation techniques provided by a processor of the

computer system, performed by the resident operating system by employing a secure-

platform interface, or configured by a system administrator via hardware partitioning

capability provided by the computer system platform.
